1. Project Overview (English)

This project, **PDF-to-Audio Converter**, is a simple yet powerful tool that converts any text-based PDF document into an audible MP3 file. It leverages Python libraries to first extract text from the PDF and then uses a **Text-to-Speech (TTS)** engine to synthesize the text into natural-sounding speech. This makes long documents accessible for listening, reading on the go, or for individuals with visual impairments or learning disabilities.

- **Key Features:**
    - Converts multi-page PDF files.
    - Saves the output as a high-quality MP3 audio file.
    - Simple command-line interface (CLI).
